

# ACT

When operators **ACT** with intention, contamination control becomes a shared responsibility, not just a requirement.

**A**

## Assume contamination is present

- Treat every surface, material, and touchpoint as a potential risk
- Recognize that contamination is often invisible

**C**

## Control your movements and actions

- Move deliberately and minimize unnecessary motion
- How you work matters as much as what you do

**T**

## Think before you touch

- Pause before contact
- A moment of thought can prevent a contamination event
